Examiner: Sanei, Hana Asmat

In Re PATENT APPLICATION Of:

Applicant(s) :	Kuo-Rong Chen et al.)
Serial No. :	10/823,759)
Filed :	April 14, 2004) REPLY AFTER For : Mesh Structure of Tetraode Field-Emission) Display and Method of Fabricating the same)) ADVISORY ACTION
Docket NO. :	OP-093000122)

February 8, 2007

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

Responsive to the Examiner's Advisory Action dated January 23, 2007, please amend the above-identified application as follows.

AMENDMENTS TO THE CLAIMS:

1. (Currently Amended) A mesh structure disposed between a plurality of anode units and cathode units of a tetraode field emission display, comprising:

 a first conductive layer to serve as a converging electrode layer having a proximal surface facing the anode units and a distal surface opposing to the proximal surface, the first conductive layer comprising a plurality of first apertures extending therethrough;

 a glass plate formed on the proximal surface of the first conductive layer to serve as a spacer, the glass plate including a plurality of second apertures extending therethrough and each second aperture covering ~~an opening range of~~ a row or a column of the first apertures;

 an insulation layer formed on the distal surface of the first conductive layer; and

 a second conductive layer formed on the insulation layer to serve as a gate electrode layer, the second conductive layer having a proximal surface facing the cathode units and a distal surface opposing to the proximal surface, wherein the second conductive layer includes a plurality of third apertures extending therethrough and aligned with the first and second apertures, and each third aperture covers ~~an opening range of~~ a row or a column of the first apertures,

 wherein a plurality of isolation slits extend across the second conductive layer so that a pair of conductive strips are formed at two elongate sides of each third aperture, each pair of the conductive strips constructs an independent conductive path to be biased with a potential and a gate operative to drain electron from the cathode unit between the pair of conductive strips is formed.

Claims 2-10 (Cancelled)

11. (Withdrawn) A method of fabricating a mesh structure mounted between an anode plate and a cathode plate of a tetra-polar field-emission display, comprising:

- providing a first conductive plate;
- forming a plurality of first apertures extending through the first conductive plate;
- providing a glass plate to serve as a spacer;
- forming a plurality of second apertures extending through the glass plate;
- temporally attaching the glass plate to one side of the first conductive plate with the second apertures aligned with the first apertures;
- providing an insulation layer formed on the other side of the first conductive plate;
- providing a second conductive plate;
- forming a plurality of third apertures extending through the second conductive plate;
- temporally attaching the second conductive plate to the insulation layer with the third apertures aligned with the first and second apertures; and
- permanently stacking the glass plate, the first conductive plate, the insulation plate and the second conductive plate to form the mesh structure.

12. (Withdrawn) The method of Claim 11, wherein the step of temporally attaching the glass plate to the first conductive plate includes applying an ultra-violet glue therebetween.

13. (Withdrawn) The method of Claim 11, wherein the step of temporally attaching the second conductive plate to the insulation layer includes applying an ultra-violet glue therebetween.

14. (Withdrawn) The method of Claim 11, wherein the step of permanently stacking the glass plate, the first conductive plate, the insulation plate and the second conductive plate includes a high-temperature sintering process.

15. (Withdrawn) The method of Claim 11, further comprising providing the first and second conductive layer fabricated from a material having a thermal expansion coefficient similar to that of the anode plate and the cathode plate.
16. (Withdrawn) The method of Claim 11, further comprising providing the glass plate having a thermal expansion coefficient similar to that of the anode plate and the cathode plate.
17. (Withdrawn) The method of Claim 11, wherein the insulation layer is a glass glue.
18. (Previously Presented) The mesh structure of Claim 1, wherein each first aperture is aligned with a corresponding anode unit with a phospher layer and cathode unit with an emission layer.

REMARKS

Claims 1 has been further amended to specifically limit each second and each third apertures covering a row or a column of the first apertures; therefore Tomii does not disclose all the limitations in Applicants' amended claim 1.

In view of the foregoing, the application is believed to be in condition for allowance. Entry of the amendments and issuance of a Notice of Allowance is therefore respectfully requested. If any additional fee is required, please charge Deposit Account Number 502751.

Respectfully submitted,
